## Common Problems and Solutions

### 1. Washer Won't Start

- **Check the power supply:** Ensure the washer is properly plugged into a working power outlet. Verify that the circuit breaker or fuse hasn't tripped.

- **Examine the lid switch:** The lid switch prevents the washer from starting if the lid is open. Inspect the switch for any damage or misalignment. Replace the switch if necessary.
- **Inspect the door latch:** The door latch holds the washer door securely closed during operation. Check if the latch is broken or malfunctioning. Replace the latch if needed.

## 2. Washer Fills But Won't Agitate

- **Examine the drive belt:** The drive belt connects the motor to the transmission, enabling the agitator to move. Check if the belt is loose, broken, or worn. Replace the belt if necessary.
- **Inspect the transmission:** The transmission transfers power from the motor to the agitator. If the transmission is faulty, the agitator may not operate properly. Contact a qualified appliance technician for transmission repairs.
- **Check the motor:** The motor is responsible for powering the washer. If the motor has failed, the agitator will not function. Contact a qualified appliance technician for motor repairs or replacement.

## 3. Washer Leaks Water

- **Examine the door gasket:** The door gasket forms a seal around the door to prevent water from leaking out. If the gasket is torn or damaged, it will need to be replaced.
- **Inspect the water inlet hoses:** The water inlet hoses supply water to the washer. Check for any cracks, leaks, or loose connections. Replace the hoses if necessary.

- **Check the drain hose:** The drain hose carries wastewater away from the washer. Ensure that the hose is not kinked, clogged, or disconnected.

#### 4. Washer Makes Excessive Noise

- **Inspect the agitator:** The agitator can become loose or unbalanced, causing excessive noise. Tighten any loose bolts or screws. If the agitator is damaged, it may need to be replaced.
- **Examine the drive belt:** A loose or worn drive belt can also cause noise. Replace the belt if necessary.
- **Check the motor:** A faulty motor can generate excessive noise. Contact a qualified appliance technician for motor repairs or replacement.

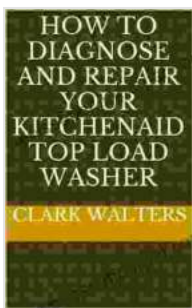

#### 5. Washer Won't Drain

- **Inspect the drain hose:** Ensure that the drain hose is not kinked, clogged, or disconnected. Clear any obstructions from the hose.
- **Examine the drain pump:** The drain pump removes water from the washer. Check if the pump is clogged with debris or damaged. Clean or replace the pump as necessary.
- **Check the lid switch:** In some models, a faulty lid switch can prevent the washer from draining. Inspect the switch for any damage or misalignment. Replace the switch if necessary.
